

OPERATIONS AND REFERENCE

ServicePro Role-Based Documentation Suite

Manuals

Publication edition | 2026-08-03

Document Control

Purpose	Enterprise platform overview and buyer evaluation reference
Audience	Business leaders, platform administrators, evaluators, partners, and technical stakeholders
Scope	Capabilities, architecture, security, deployment, adoption, outcomes, and terminology
Source	ServicePro repository documentation; technical meaning preserved

The in-application Documents workspace is the authoritative rendered manual. It applies runtime role filtering:

Viewer	Available manuals
Platform administrator	Platform Admin, Developer/Integration, Owner, Staff
Tenant owner	Owner, Staff
Staff/technician	Staff

Internal platform and developer procedures must not be copied into tenant-visible knowledge articles. The source content is maintained in `apps/web/src/components/DocumentationWorkspace.tsx`.

- Platform Administrator Guide — Render, Cloudflare, Supabase, migrations, RLS, storage, secrets, owner access, module entitlements, themes, audit, releases.
- Web Developer & Technical Integration Guide — architecture, guards, repositories, environment variables, module/migration/theme extensibility.
- Business Owner Guide — activation, entitlement boundaries, teams, storefronts, service pages, and leads.
- Staff & Field Technician Guide — permissions, daily operations, customers, jobs, assets, inventory, billing boundaries, and security.

Documentation change control

- 1 Update the in-application manual.
- 2 Confirm the intended audience.
- 3 Add or update tests for access filtering and required content.
- 4 Run the frontend production build.
- 5 Have a platform administrator review security-sensitive instructions.
- 6 Deploy the same commit to the API and web environments.
