

RELEASE DOCUMENTATION

ServicePro 8.0.0-alpha.1 — Final Release Certification

Executive conclusion

Publication edition | 2026-08-03

Document Control

Purpose	Enterprise platform overview and buyer evaluation reference
Audience	Business leaders, platform administrators, evaluators, partners, and technical stakeholders
Scope	Capabilities, architecture, security, deployment, adoption, outcomes, and terminology
Source	ServicePro repository documentation; technical meaning preserved

Certification date: 2026-07-27 Certified branch: release/8.0.0-alpha.1-remediation Version: 8.0.0-alpha.1 Decision: CONDITIONAL GO for alpha deployment

ServicePro is working end to end in the locally certifiable release boundary. Dependencies install, the production bundle builds, all 763 test files pass, a blank PostgreSQL database migrates through all 685 migrations, authenticated operational workflows persist, tenant isolation is enforced, backup/restore succeeds, and the browser experience works at desktop and mobile sizes.

“Conditional” reflects external-environment work that cannot be truthfully certified from a local workstation: a live Render/Cloudflare deployment, production secrets and DNS, provider-backed payment settlement, and production telemetry. These are deployment gates, not known application failures.

Release gates

Gate	Result
Repository and package integrity	Pass
Root clean install	Pass — 0 reported vulnerabilities
Frontend clean install	Pass — offline audit reported 0 vulnerabilities
TypeScript validation	Pass
Production build	Pass — 43 static routes
Automated regression suite	Pass — 763/763 test files
Blank PostgreSQL migration	Pass — 685 migrations
Migration idempotency	Pass — 0 applied, 685 skipped on replay
PostgreSQL application smoke	Pass
Core business workflow persistence	Pass
Cross-tenant isolation	Pass
PostgreSQL backup and restore	Pass
Redis service connectivity	Pass
Authenticated desktop browser smoke	Pass
Mobile responsive browser smoke	Pass
Production manifest validation	Pass
Live hosted deployment	Not tested

Approved next action

Deploy this branch to a non-production environment using managed PostgreSQL, inject environment-specific secrets and origins, execute the migration/pre-deploy gate, and repeat the smoke and rollback checklist in DEPLOYMENT-READINESS.md. Do not promote directly to production without that environment certification.
