1. Executive Summary

ServicePro is a unified, multi-tenant SaaS platform purpose-built for field service businesses. It consolidates operations, scheduling, customer management, billing, inventory, AI assistance, marketing, and digital presence into a single system accessible from any device.

Rather than stitching together point solutions for dispatching, invoicing, CRM, and website management, service businesses operate from one platform where data flows between modules without manual re-entry. A plumber dispatched to a job sees the customer's equipment history, completes the work order, triggers an invoice, and updates inventory — all in the same session.

ServicePro serves the entire ecosystem around a service business: office staff manage operations, technicians work in the field, customers self-serve through a dedicated portal, and business owners track performance through real-time analytics.

The platform is deployed as a cloud-native application with subdomain-isolated services, JWT-based authentication, role-driven authorization, and tenant-level data isolation. It supports both JSON-based lightweight deployments and PostgreSQL-backed production environments.

Why ServicePro

- Single platform, complete operations — CRM, scheduling, dispatch, work orders, invoicing, inventory, customer portal, website, and AI in one login
- Multi-tenant architecture — each business operates in an isolated data space with configurable branding, features, and settings
- Role-aware interface — technicians, dispatchers, office staff, managers, and customers each see purpose-built views
- 30+ industry service packs — pre-configured templates, checklists, and pricing for specific trades from HVAC to solar
- AI-powered assistance — knowledge base chat, workflow recommendations, and predictive capabilities
- Customer self-service portal — branded portal where customers book, pay, and communicate without phone calls
- API-first design — RESTful API with JWT authentication enabling integrations and custom development
- Progressive deployment — start on a free Render tier and scale to enterprise PostgreSQL-backed production

2. Business Challenges ServicePro Addresses

Business Challenge	Operational Impact	ServicePro Response	Expected Benefit
Fragmented software stack	Data silos between scheduling, billing, and CRM systems; manual data re-entry	Unified platform with shared data model across all operational modules	Single source of truth; reduced duplicate entry
Paper-based field operations	Delayed job updates, lost paperwork, unbilled labor	Digital work orders with mobile-first technician interface	Real-time job status, faster invoicing
No customer self-service	High call volume for scheduling, payment, and status inquiries	Dedicated customer portal with booking, payments, and messaging	Reduced inbound calls; improved customer experience
Scheduling inefficiency	Double-bookings, drive-time waste, unbalanced technician loads	Dispatch board with technician calendars and territory management	Higher daily job completion; lower fuel costs
Slow estimate-to-invoice cycle	Revenue leakage from unapproved estimates and delayed invoicing	Estimates convert to invoices in one click; online payment links	Faster collections; fewer lost opportunities
Inventory visibility gaps	Truck stock-outs, over-ordering, unknown part locations	Warehouse and truck inventory with transfers, alerts, and purchase orders	Reduced stock-outs; lower carrying costs
No digital presence	Reliance on word-of-mouth; no online booking capability	Built-in website builder with public storefront and SEO tools	New customer acquisition channel
Limited reporting	Decisions based on intuition rather than data	Pre-built and custom report builder with scheduled delivery	Data-informed operational decisions
Compliance and audit risk	No centralized audit trail; manual compliance tracking	Automated audit logging, compliance controls, and evidence collection	Audit readiness; reduced compliance effort
Team communication gaps	Missed handoffs between office and field; customer left uninformed	Integrated notifications, message templates, and real-time updates	Fewer missed communications; better coordination

3. Product Overview

ServicePro is structured as a monorepo containing multiple deployable applications and shared packages. Each application serves a distinct audience and can be deployed independently.

Application Ecosystem

Application	Audience	Purpose
Tenant App (apps/web)	Business staff	Primary workspace for all operational modules
API Service (apps/api)	All clients	RESTful backend handling business logic and data
Customer Portal (apps/customer-portal)	End customers	Self-service booking, payments, messages, and documents
Admin App (apps/admin)	Platform operators	Tenant management, monitoring, security, and deployment
Mobile App (apps/mobile)	Field technicians	Field-optimized interface for job execution

Shared Packages

Package	Function
packages/auth	Authentication utilities, JWT handling, session management
packages/ui	Design system components shared across frontends
packages/types	TypeScript type definitions for cross-application consistency
packages/shared	Validation, constants, and utility functions
packages/database	Database connection and query utilities
packages/scheduling	Scheduling logic and calendar operations
packages/dispatch	Dispatch algorithms and assignment logic
packages/crm	Customer relationship management utilities
packages/invoices	Invoice generation and calculation logic
packages/estimates	Estimate creation and pricing logic
packages/inventory	Stock management and transfer logic
packages/jobs	Work order lifecycle management
packages/reporting	Report generation and data aggregation
packages/workflows	Automation rules and event processing
packages/integrations	Third-party connector framework
packages/pricing	Price book and service pricing engine
packages/customers	Customer data management utilities
packages/workforce	Technician and team management
packages/audit	Audit trail and compliance logging
packages/config	Runtime configuration management

4. Capabilities Summary

Capability Area	Primary Users	Core Functions	Business Value	Availability
Platform Administration	Platform admins	Tenant lifecycle, feature gates, monitoring, deployments	Centralized control of multi-tenant operations	Available
Tenant Management	Business owners, admins	Company settings, branding, user management, modules	Self-service business configuration	Available
CRM & Sales	Sales reps, managers	Leads, opportunities, customer profiles, pipeline	Revenue pipeline visibility and growth	Available
Scheduling & Dispatch	Dispatchers, managers	Calendar, technician assignment, territory management	Optimized field resource utilization	Available
Customer Portal	End customers	Booking, invoices, payments, messages, documents	Self-service reduces support volume	Available
Inventory & Procurement	Inventory managers	Stock levels, transfers, purchase orders, warehouses	Reduced stock-outs and carrying costs	Available
Billing & Financial Operations	Finance, office staff	Estimates, invoices, payments, price books	Faster revenue collection	Available
Reporting & Analytics	Managers, executives	Dashboards, report builder, scheduled reports, exports	Data-driven decision making	Available
AI Capabilities	All users	Chat assistant, knowledge base, recommendations	Faster resolution, reduced training time	Available
Website Builder & Digital Growth	Marketing, admins	Page builder, themes, SEO, public storefront	Online customer acquisition	Available

Capability Area	Primary Users	Core Functions	Business Value	Availability
Marketplace	Admins, business owners	Industry packs, connectors, themes, extensions	Tailored workflows per trade	Available
Notifications & Communications	All internal users	Templates, alerts, real-time updates, reminders	Coordinated team and customer communication	Available
Files, Documents & Media	Technicians, office staff	Attachments, media uploads, document management	Digital record keeping	Available
Authentication & Security	IT admins, security	JWT auth, MFA, RBAC, audit trails, rate limiting	Enterprise-grade access control	Available
Automation & Workflows	Managers, admins	Rule engine, triggers, conditions, job transitions	Eliminated manual repetitive tasks	Available
APIs & Integrations	Developers, partners	REST API, webhooks, marketplace connectors	Extensibility and ecosystem connectivity	Available

5. Feature-by-Feature Breakdown

5.1 Platform Administration

What it does: Provides platform operators with centralized management of the entire multi-tenant SaaS environment including tenant lifecycle, feature configuration, monitoring, and security oversight.

Key functions:

- Platform dashboard with tenant health metrics and system status
- Tenant creation, archiving, restoration, and soft-deletion
- Feature gates and module access control per tenant
- Subscription and entitlement management
- Platform audit logs and security event monitoring
- Deployment configuration and release management
- Health monitoring and performance metrics
- API key management and OAuth configuration
- Session management and impersonation for support
- Recovery operations for archived tenants and deleted owners

Customer benefits: Platform operators maintain full control over the SaaS environment from a single administrative interface. Tenant isolation is enforced at the platform level, and operators can respond to issues without accessing production databases directly.

Primary users: Platform administrators, DevOps engineers, support escalation teams

Enterprise considerations: Platform administration is protected behind additional access controls. The admin interface supports role-based access so platform operations teams can be segmented by responsibility (billing vs. security vs. tenant support).

Availability: Available

5.2 Tenant Management

What it does: Enables each business (tenant) to configure their operational environment, branding, features, users, and settings without affecting other tenants on the platform.

Key functions:

- Company profile and branding configuration (logos, colors, contact details)
- Feature toggle management (enable/disable modules per business needs)
- User invitation and team member management
- Role assignment and permission configuration
- API key generation for programmatic access
- Custom domain configuration
- Tenant settings for business hours, service areas, and operational preferences

Customer benefits: Each business customizes ServicePro to match their brand, industry, and operational needs without IT involvement. New team members are onboarded with appropriate role-based access in minutes.

Primary users: Business owners, company administrators

Enterprise considerations: Multi-workspace support allows organizations managing multiple brands or locations to maintain separate tenant configurations while sharing platform administration.

Availability: Available

5.3 CRM and Sales

What it does: Manages the customer lifecycle from initial lead through to ongoing service relationship. Tracks contacts, sales opportunities, pipeline stages, and customer communication history.

Key functions:

- Customer database with contact details, service history, and notes
- Lead management with source tracking and pipeline stages
- CRM pipeline visualization for opportunity tracking
- Customer search and filtering with advanced queries
- Organization and account hierarchy management
- Marketing campaign tracking and attribution
- Customer asset records linked to service history
- Territory-based customer assignment

Customer benefits: Sales and office teams track every lead and customer interaction in context. No more lost sticky notes or forgotten callbacks — the pipeline provides visibility into revenue opportunities at every stage.

Primary users: Sales representatives, office managers, business owners

Enterprise considerations: Territory management enables geographic or team-based customer segmentation. Organization hierarchy supports B2B relationships where one account manages multiple service locations.

Availability: Available

5.4 Scheduling and Dispatch

What it does: Provides a visual dispatch board and scheduling system for assigning technicians to jobs based on availability, skills, location, and priority.

Key functions:

- Interactive dispatch board with drag-and-drop assignment
- Technician calendar with daily, weekly, and monthly views
- Appointment scheduling with time-window preferences
- Territory management for geographic routing
- Route planning for optimized drive sequences
- Technician availability and skill-based matching
- Real-time status tracking (en route, on-site, completed)
- Emergency and priority job escalation
- Capacity utilization reporting

Customer benefits: Dispatchers fill schedules efficiently, reduce windshield time between jobs, and respond to emergencies without disrupting the rest of the day's appointments. Technicians see their day clearly and navigate directly to each site.

Primary users: Dispatchers, operations managers, technicians

Enterprise considerations: Multi-territory dispatch supports organizations operating across regions. Route optimization reduces fuel costs and increases daily job capacity. AI-powered dispatch recommendations are available as an enterprise option.

Availability: Available (core dispatch), Preview (AI-assisted dispatch optimization)

5.5 Customer Portal

What it does: Provides a branded, self-service web application where end customers can manage their service relationship without phone calls or emails.

Key functions:

- Customer login with secure authentication
- Appointment booking with service type selection and preferred dates
- Invoice viewing and online payment
- Estimate review, approval, and decline
- Service history and completed job details

- Equipment/asset records with maintenance history
- Secure messaging with the service team
- Document access (contracts, warranties, inspection reports)
- Profile management and contact preferences

Customer benefits: Customers interact with the business on their own schedule. A homeowner can book a maintenance visit at 10 PM, pay an invoice from their phone, and check their equipment warranty — all without a single phone call. This reduces inbound call volume and improves customer satisfaction.

Primary users: Residential and commercial customers

Enterprise considerations: The portal is deployed as an independent application at a dedicated subdomain, allowing it to scale independently from internal operations. Portal authentication uses dedicated tokens (Customer JWT) scoped exclusively to customer-audience routes.

Availability: Available

5.6 Inventory and Procurement

What it does: Tracks parts, materials, and equipment across warehouses and service vehicles. Manages purchasing workflows from requisition through receiving.

Key functions:

- Multi-warehouse inventory with location-level stock tracking
- Truck/vehicle inventory for field technician stock
- Stock transfers between locations with approval workflows
- Purchase order creation, submission, and receiving
- Low-stock alerts and reorder point configuration
- Material usage tracking linked to work orders
- Stock adjustment and count management
- Vendor management with pricing and lead time data
- Inventory valuation and cost reporting

Customer benefits: Technicians arrive at jobs with the right parts. Office staff stop emergency parts runs. Purchase decisions are based on actual usage data rather than estimates, reducing both stock-outs and over-ordering.

Primary users: Inventory managers, purchasing coordinators, technicians, warehouse staff

Enterprise considerations: Multi-warehouse support accommodates organizations with central distribution and satellite locations. Integration connectors enable synchronization with external procurement systems.

Availability: Available

5.7 Billing and Financial Operations

What it does: Manages the revenue lifecycle from service pricing through estimate creation, invoice generation, payment collection, and financial reporting.

Key functions:

- Price book management with service, labor, and material rates
- Estimate creation with line items, taxes, and discounts
- Estimate-to-invoice conversion in a single action
- Invoice generation with configurable templates
- Online payment processing (integration dependent)
- Payment recording and receipt generation
- Recurring billing and service agreement invoicing
- Tax calculation and financial categorization
- Financial dashboards with revenue, outstanding, and collected metrics
- Accounts receivable aging and collection status

Customer benefits: The estimate-to-invoice-to-payment flow eliminates manual re-entry. Customers receive professional estimates and invoices with online payment links, accelerating collections and reducing days-sales-outstanding.

Primary users: Finance staff, billing coordinators, office managers, business owners

Enterprise considerations: Price book supports tiered pricing (residential vs. commercial rates). Service agreements enable recurring revenue management. Payment processing requires connector configuration with a supported payment provider.

Availability: Available (invoicing, estimates, price books), Integration Dependent (online payment processing)

5.8 Reporting and Analytics

What it does: Provides pre-built operational reports, custom report creation, scheduled report delivery, and data export capabilities for business intelligence.

Key functions:

- Pre-built report catalog (revenue, jobs, technician performance, customer metrics)
- Report dashboard with KPI cards and trend visualization
- Scheduled report delivery (email delivery on defined cadences)
- CSV and data export for external analysis
- Report filtering by date range, status, technician, customer, and territory
- Custom report builder with field selection and aggregation
- Financial reporting (P&L-style revenue and expense views)

Customer benefits: Managers make decisions based on current data rather than gut feel. Owners receive weekly performance summaries without logging in. The export capability enables integration with external BI tools when deeper analysis is needed.

Primary users: Business owners, operations managers, financial managers

Enterprise considerations: Report scheduling enables automated delivery to stakeholders. Data export supports integration with data warehouse and BI platforms. Enterprise analytics with embedded BI dashboards are available as an advanced option.

Availability: Available (reports, exports, schedules), Enterprise Option (embedded BI, predictive analytics)

5.9 AI Capabilities

What it does: Provides an AI-powered assistant that helps users find information, get recommendations, and interact with the platform through natural language. Backed by a configurable knowledge base.

Key functions:

- AI chat assistant accessible from within the application workspace
- Knowledge base management with searchable articles
- AI-powered knowledge retrieval and contextual suggestions
- Knowledge article creation, editing, categorization, and tagging
- Article attachments and media support
- Role-based knowledge access (internal articles vs. customer-facing)
- AI governance and model management (platform admin level)

Customer benefits: New employees get answers instantly without interrupting colleagues. Technicians in the field look up repair procedures from their mobile device. The knowledge base compounds in value as the team documents solutions to recurring issues.

Primary users: All internal users (AI assistant), knowledge managers (content authoring), platform admins (AI governance)

Enterprise considerations: AI governance controls enable platform administrators to manage model configurations, usage policies, and cost controls. Enterprise RAG (retrieval-augmented generation), embeddings, and forecasting services are designed as part of the planned multi-app architecture.

Availability: Available (AI assistant, knowledge base), Preview (AI governance, model management), Planned (dedicated AI microservice with RAG and embeddings)

5.10 Website Builder and Digital Growth

What it does: Enables service businesses to build, customize, and publish a professional website and public-facing storefront without external tools or web developers.

Key functions:

- Visual website editor with page creation and layout tools
- Storefront builder for public service presentation
- Theme selection and customization
- SEO configuration for search engine visibility

- Public-facing service catalog with booking capability
- Media management for images and marketing assets
- Starter service templates for quick launch
- Mobile-responsive design output
- Integration with the booking and inquiry system

Customer benefits: A service business gets a professional web presence that directly feeds into their operational system. A customer browsing the website can request service, which flows directly into the dispatch queue — no manual re-entry, no lost leads from contact forms.

Primary users: Marketing managers, business owners, website administrators

Enterprise considerations: Multi-site businesses can configure separate storefronts per location or brand. Custom domain support is available for professional branding.

Availability: Available

5.11 Marketplace

What it does: Provides a catalog of industry-specific service packs, integration connectors, themes, and extensions that businesses can install to tailor ServicePro to their trade.

Key functions:

- 30+ industry service packs (plumbing, HVAC, electrical, landscaping, etc.)
- Each pack includes: pricebook categories, equipment types, checklists, and job templates
- Integration connectors (accounting, payments)
- Workspace themes for UI customization
- Extension modules (customer communications templates)
- One-click installation and uninstallation
- Installation tracking and management

Customer benefits: Instead of spending weeks configuring the platform for their trade, a pest control company installs the Pest Control Pack and immediately has industry-specific terminology, checklists, and workflows. Time-to-value drops from weeks to minutes.

Primary users: Business owners, company administrators

Enterprise considerations: The marketplace architecture supports third-party extension publishing and partner ecosystem development. Custom service packs can be developed for unique industry requirements.

Availability: Available

5.12 Notifications and Communications

What it does: Manages internal notifications, customer communications, and automated messaging across the platform with configurable templates and delivery channels.

Key functions:

- Real-time in-app notifications for assignments, updates, and alerts
- Message template management (appointment confirmations, arrival alerts, review requests)
- Communication center for centralized message tracking
- Reminder system for follow-ups, payments, and appointments
- Notification preferences and channel configuration
- Communication history linked to customer and job records

Customer benefits: The right people get the right information at the right time. Technicians receive assignment notifications instantly. Customers get automated appointment confirmations and arrival alerts without manual effort from office staff.

Primary users: All internal users (receive notifications), office staff and managers (configure templates), customers (receive communications)

Enterprise considerations: Template-driven communications enable brand-consistent messaging at scale. Communication audit trails support compliance requirements.

Availability: Available

5.13 Files, Documents, and Media

What it does: Provides file upload, attachment, and document management capabilities across the platform, enabling digital record keeping for jobs, assets, and customers.

Key functions:

- File upload and attachment to jobs, assets, customers, and knowledge articles
- Media attachment management with metadata
- Document access through the customer portal
- Photo documentation for job sites (before/after)
- Configurable upload size limits via body limit middleware
- Asset attachment records for equipment documentation

Customer benefits: Technicians photograph issues on-site and attach them directly to the work order. Customers access their inspection reports and warranties through the portal. Paper files are replaced with searchable digital records.

Primary users: Technicians (field documentation), office staff (record keeping), customers (document access)

Enterprise considerations: File storage is managed through the API service with configurable payload limits. A dedicated files microservice is designed for enterprise deployments to isolate large upload processing from API response times.

Availability: Available (API-managed uploads), Planned (dedicated files microservice)

5.14 Authentication, Authorization, and Security

What it does: Provides a comprehensive security framework including authentication, role-based access control, audit trails, and security monitoring.

Key functions:

- JWT-based authentication with configurable token lifetimes
- Multi-factor authentication (MFA) support
- Role-based access control with six preset roles (owner, admin, manager, technician, billing, read-only)
- Granular permission system with module-level access control
- Tenant-scoped data isolation (every query filtered by tenant context)
- Audience-separated tokens (portal tokens vs. platform tokens)
- Rate limiting (configurable per endpoint category)
- Security headers (applied to all responses)
- Audit trail with request logging and security event capture
- Session management and forced logout
- Password reset with token-based verification
- Invitation-based onboarding with activation links
- API key management for programmatic access

Customer benefits: Businesses have confidence that their data is isolated from other tenants, employees see only what their role allows, and the platform defends against common attack patterns (brute force, token theft, CORS bypass) out of the box.

Primary users: IT administrators (configuration), all users (consume), security reviewers (audit)

Enterprise considerations: Platform-level security includes Cloudflare Access integration for admin interfaces, CORS origin whitelisting with wildcard rejection, host-only cookies preventing cross-subdomain leakage, and environment variable isolation between services. Compliance automation features (SOC 2, ISO 27001 frameworks) are available at the enterprise tier.

Availability: Available (JWT auth, RBAC, MFA, audit, rate limiting), Configurable (token lifetimes, rate limits, CORS origins), Enterprise Option (compliance automation, advanced security monitoring)

5.15 Automation and Enterprise Operations

What it does: Provides a rule-based workflow engine that automates repetitive business processes, job state transitions, and notification triggers based on configurable conditions.

Key functions:

- Workflow rule engine with trigger-condition-action model
- Job state machine with configurable transitions
- Automated notifications on status changes
- Workflow event history and execution logging

- Automation builder interface for visual rule creation
- Business continuity and operational risk management
- Compliance control monitoring and evidence fulfillment
- Policy management and lifecycle tracking
- Data retention and privacy automation (DSAR, consent, breach notifications)
- SLA monitoring and alerting

Customer benefits: Repetitive tasks happen automatically. When a job is marked complete, the invoice generates, the customer gets a satisfaction survey, and the review request fires — all without manual intervention. Compliance workflows ensure regulatory requirements are met consistently.

Primary users: Operations managers (workflow design), all users (benefit from automation), compliance teams (governance)

Enterprise considerations: Enterprise operations extend into GRC (governance, risk, and compliance) with automated evidence collection, policy lifecycle management, and regulatory compliance tracking. Privacy operations support DSAR processing, consent management, and breach notification workflows.

Availability: Available (workflow engine, job transitions), Available (privacy operations, data retention), Enterprise Option (compliance automation, risk management frameworks)

5.16 APIs and Integrations

What it does: Exposes a comprehensive REST API enabling programmatic access to all platform functions, plus a marketplace of pre-built connectors for common external systems.

Key functions:

- RESTful API with versioned endpoints (/api/v1/)
- JWT Bearer token authentication for API access
- Per-tenant API key management for service integrations
- OpenAPI specification for developer documentation
- CORS configuration with explicit origin whitelisting
- Paginated list endpoints with filtering and sorting
- Webhook platform for event-driven integrations
- Marketplace connectors (accounting, payments)
- Rate limiting with configurable thresholds
- Request/response validation

Customer benefits: The API enables everything from simple Zapier-style automations to full custom application development on top of ServicePro data. Accounting connectors eliminate double-entry between field operations and bookkeeping software.

Primary users: Developers, integration partners, IT administrators

Enterprise considerations: The OpenAPI contract (servicepro-openapi.yaml) provides a machine-readable API specification. API versioning protects integrations from breaking changes. Developer portal and SDK are part of the

platform roadmap.

Availability: Available (REST API, API keys, marketplace connectors), Configurable (rate limits, CORS), Planned (GraphQL API, developer portal)

6. Role-Based Value

Business Owner

- Full visibility into revenue, job completion, and team performance from the executive dashboard
- Track leads through the pipeline and monitor conversion rates
- Review financial KPIs without waiting for monthly reports
- Configure services, pricing, and branding to match business identity
- Marketplace packs get the platform ready for their specific trade immediately

Executive / Senior Manager

- Real-time operational KPIs: revenue, utilization, customer satisfaction
- Scheduled report delivery for weekly performance summaries
- Organization-wide view of multi-location or multi-team operations
- Strategic planning data from historical trends and pipeline forecasts

Platform Administrator

- Complete tenant lifecycle management from a single admin interface
- Feature gate control to enable or restrict modules per tenant
- Security monitoring, audit log review, and incident response
- Deployment management including release tracking and health monitoring
- Subscription and entitlement administration

Tenant Administrator (Company Admin)

- User management: invite, assign roles, configure permissions
- Branding and company profile customization
- Module activation and feature configuration
- API key management for integrations
- Workflow automation rules and business configuration

Operations Manager

- Dispatch board oversight and team utilization metrics

- SLA monitoring and job priority management
- Workflow automation to reduce manual coordination
- Report access for team performance and operational efficiency
- Customer satisfaction tracking and follow-up management

Dispatcher

- Visual dispatch board with real-time technician locations and status
- Drag-and-drop job assignment with skill and territory matching
- Emergency escalation and priority reassignment
- Schedule gap identification and backfill optimization
- Appointment confirmation and customer notification triggers

Technician

- Mobile-first daily schedule with navigation-ready addresses
- Work order details, customer history, and asset records in the field
- Checklist-driven job completion for consistent quality
- Parts and material usage logging from truck inventory
- Time tracking with clock-in/clock-out and job-level time entries
- Photo documentation and note capture on site

Sales Representative

- Lead management with source tracking and follow-up tasks
- Pipeline visualization with stage-based opportunity tracking
- Estimate creation with price book integration for accurate quoting
- Customer communication history for informed conversations
- Territory assignment for geographic focus

Customer Service Representative

- Customer lookup with full service and communication history
- Appointment scheduling and rescheduling on behalf of customers
- Invoice and payment status for billing inquiries
- Knowledge base access for quick issue resolution
- Message templates for consistent customer communication

Inventory Manager

- Multi-warehouse stock visibility with location-level detail

- Low-stock alerts and reorder point configuration
- Purchase order management from creation to receiving
- Transfer tracking between warehouses and trucks
- Usage reporting to identify consumption patterns and optimize ordering

Finance User

- Invoice management with aging and collection tracking
- Payment recording and reconciliation
- Estimate review and approval workflows
- Financial report access and export capability
- Price book maintenance for service and material rates

Marketing Manager

- Campaign management and execution tracking
- Website content management through the built-in editor
- Storefront configuration for online service presentation
- Review and reputation management
- Customer communication templates and sequence design

Website Administrator

- Page builder for creating and editing website content
- Theme and branding configuration
- SEO settings and metadata management
- Public storefront service catalog management
- Media library for images and marketing assets

Customer (Portal User)

- Self-service appointment booking at any time, from any device
- Invoice viewing with online payment capability
- Estimate review with approve/decline actions
- Service history and completed job records
- Equipment and asset records with maintenance history
- Secure messaging with the service team
- Document access (contracts, reports, warranties)

IT Administrator

- Security configuration (MFA policies, token lifetimes, rate limits)
- Integration management (API keys, CORS origins, webhook configuration)
- Audit log review and security event investigation
- User access reviews and permission auditing
- System health monitoring and performance metrics

Security Reviewer

- Audit trail access with comprehensive request logging
- Security event monitoring and alerting
- Compliance control status and evidence tracking
- Data privacy operation oversight (DSAR, consent, retention)
- Integrity checks and configuration validation

Developer / Integration Partner

- REST API with JWT authentication for custom integrations
- OpenAPI specification for contract-first development
- API key management for service-to-service authentication
- Marketplace connector architecture for third-party development
- Rate limit awareness for responsible API consumption

7. Industry Applications

ServicePro supports over 30 industry verticals through its marketplace service packs. Each pack configures the platform with trade-specific terminology, checklists, equipment types, pricing structures, and job templates.

Industry	Service Pack	Key Capabilities
Plumbing	Plumbing Operations Pack	Drain/sewer workflows, water heater tracking, fixture service templates
HVAC	HVAC Service Pack	Maintenance plans, diagnostic checklists, equipment lifecycle management
Electrical	Electrical Contractor Pack	Panel schedules, inspections, permit tracking workflows
Carpet & Upholstery Cleaning	Carpet & Upholstery Pack	Room measurements, treatment tracking, recurring service plans
Landscaping	Landscaping Operations Pack	Property zones, crew routing, seasonal work scheduling
Residential Cleaning	Residential Cleaning Pack	Room checklists, recurring visit plans, customer preferences
Commercial Janitorial	Commercial Janitorial Pack	Facility zones, quality inspections, supply controls
Pest Control	Pest Control Pack	Treatment records, device monitoring, compliance logs
Roofing	Roofing Contractor Pack	Roof diagrams, material takeoffs, claims documentation
Garage Door Service	Garage Door Service Pack	Door assets, safety checks, spring lifecycle tracking
Appliance Repair	Appliance Repair Pack	Model diagnostics, parts tracking, warranty service
Handyman	Handyman Services Pack	Multi-task jobs, project punch lists, flexible estimates
Painting	Painting Contractor Pack	Color schedules, surface measurements, paint usage tracking

Industry	Service Pack	Key Capabilities
Pressure Washing	Pressure Washing Pack	Area-based pricing, chemical tracking, photo documentation
Pool & Spa	Pool & Spa Service Pack	Chemistry logs, route service, seasonal care workflows
Locksmith & Security	Locksmith & Security Pack	Key records, access control, security hardware documentation
Tree Care	Tree Care & Arborist Pack	Tree inventory, risk assessments, treatment plans
Snow & Ice Management	Snow & Ice Management Pack	Storm dispatch, salt usage, proof of service
Irrigation	Irrigation Service Pack	Zone maps, controller records, winterization workflows
Septic & Wastewater	Septic & Wastewater Pack	System assets, pumping history, disposal records
Chimney & Fireplace	Chimney & Fireplace Pack	Inspection levels, sweeping records, safety findings
Solar	Solar Service Pack	System commissioning, production checks, battery service
Home Inspection	Home Inspection Pack	Structured findings, photo evidence, client reports
Restoration & Remediation	Restoration & Remediation Pack	Moisture mapping, equipment logs, loss documentation
Moving Services	Moving Services Pack	Inventory surveys, truck planning, delivery proof
Junk Removal	Junk Removal Pack	Volume pricing, load capacity, disposal tracking
Window & Gutter Cleaning	Window & Gutter Cleaning Pack	Measurement pricing, access notes, recurring routes
Flooring	Flooring Installation Pack	Room takeoffs, waste factors, installation milestones
Property Maintenance	Property Maintenance Pack	Multi-site assets, preventive plans, owner reporting
Fencing	Fence & Gate Pack	Linear estimates, material layouts, gate hardware

> Additional industry solution frameworks (healthcare operations, manufacturing maintenance, government services, utilities, transportation, telecommunications, education, and retail) are in development as enterprise-tier offerings.

8. Pricing and Packaging

> Notice: Pricing tiers, feature allocations, and per-seat costs presented below represent the product packaging structure. Final pricing must be determined and approved by commercial leadership before publication to customers.

Tier Overview

Tier	Target Customer	Core Value Proposition
Essentials	Solo operators, small teams (1–3 users)	Core scheduling, invoicing, and customer management
Professional	Growing businesses (4–15 users)	Full dispatch, inventory, CRM, and customer portal
Business	Mid-market companies (16–50 users)	Automation, reporting, marketplace, and website builder
Enterprise	Large organizations (50+ users)	Advanced security, compliance, multi-location, AI, and dedicated support
Platform	SaaS operators, white-label partners	Full platform administration, multi-tenant management, and API access

Feature Comparison

Feature	Essentials	Professional	Business	Enterprise	Platform
Work orders & jobs	✓	✓	✓	✓	✓
Customer management	✓	✓	✓	✓	✓
Scheduling & calendar	✓	✓	✓	✓	✓
Estimates & invoices	✓	✓	✓	✓	✓

Feature	Essentials	Professional	Business	Enterprise	Platform
Dispatch board	—	✓	✓	✓	✓
Customer portal	—	✓	✓	✓	✓
Inventory management	—	✓	✓	✓	✓
CRM & lead pipeline	—	✓	✓	✓	✓
Workflow automation	—	—	✓	✓	✓
Reporting & analytics	Basic	Standard	Advanced	Advanced	Advanced
Website builder	—	—	✓	✓	✓
Marketplace packs	1 included	3 included	Unlimited	Unlimited	Unlimited
AI assistant	—	—	✓	✓	✓
Knowledge base	—	✓	✓	✓	✓
API access	—	Read-only	Full	Full	Full
MFA enforcement	—	Optional	Optional	Required	Required
Audit trail	—	—	90 days	Unlimited	Unlimited
Compliance controls	—	—	—	✓	✓
Platform administration	—	—	—	—	✓
Multi-tenant management	—	—	—	—	✓
Custom domain	—	—	✓	✓	✓
Dedicated support	—	—	—	✓	✓
SLA guarantees	—	—	—	✓	✓

9. Enterprise Technical Capabilities

This section is intended for CIOs, CTOs, solution architects, and technical evaluators.

Multi-Tenant Architecture

ServicePro implements tenant isolation at the application layer. Every API request is processed through tenant middleware that attaches the authenticated user's tenant context. All data queries are scoped to the active tenant, preventing cross-tenant data access regardless of API input.

- Tenant resolution: Extracted from authenticated JWT claims on every request
- Data isolation: All repository queries include tenant ID as a mandatory filter
- Configuration isolation: Each tenant maintains independent settings, branding, and module configurations
- Environment isolation: Platform administration operates with separate authentication tokens (Platform JWT) and elevated access controls

Data Storage

Storage Option	Use Case	Characteristics
JSON file store	Development, demos, small single-tenant deployments	Zero-dependency, file-backed, suitable for evaluation
PostgreSQL	Production, multi-tenant, enterprise deployments	Full ACID compliance, migration-managed schema, connection pooling

The data layer is abstracted through a store provider pattern (storeProvider.js) that routes data operations to the configured backend. Schema evolution is managed through numbered SQL migrations in the migrations/postgres/ directory.

API Architecture

- Protocol: HTTP/HTTPS RESTful API
- Authentication: JWT Bearer tokens with configurable TTL
- Authorization: Permission-checked at route level before handler execution
- Versioning: Path-based (/api/v1/)
- Pagination: Offset-based with configurable page sizes
- Validation: Request body and query parameter validation middleware
- Error handling: Structured JSON error responses with error codes
- Rate limiting: Configurable per-window request limits with separate auth endpoint limits
- CORS: Explicit origin whitelist; wildcard origins rejected
- Content limits: Configurable maximum request body size

Service Boundaries

The platform follows a modular monolith design where business domains are separated into distinct packages (packages/*) and route groups (routes/*). Module access is enforced through the moduleAccessGuard middleware, which verifies that the requesting tenant has been granted access to the target module.

Current module boundaries:

- Operations (jobs, appointments, dispatch, workflows)
- CRM (customers, organizations)
- Assets (customer assets, equipment)
- Inventory (stock, materials, warehouses, transfers, purchasing)
- Billing (estimates, invoices, payments, price books)
- Analytics (reports, exports)
- Knowledge (articles, search)
- Communications (notifications, messages, templates)
- Marketplace (service packs, connectors, themes)
- Administration (tenant settings, audit, security, team management)

Build and Deployment Pipeline

- Monorepo management: Turborepo with workspace-level task dependencies
- CI/CD: GitHub Actions workflows for build, test, release, and deployment verification
- Release process: Multi-stage pipeline including evidence collection, policy gates, provenance attestation, and deployment authorization

- Container support: Dockerfile and docker-compose configurations for containerized deployments
- Health checks: Dedicated /healthz and /readyz endpoints for orchestrator integration

Technology Stack

Layer	Technology
Backend runtime	Node.js 20
API framework	Native HTTP with custom routing
Frontend framework	Next.js (React)
Database	PostgreSQL (production), JSON file (development)
Authentication	JWT (jsonwebtoken / jose)
Build orchestration	Turborepo
CI/CD	GitHub Actions
Hosting	Render (web services)
CDN / DNS	Cloudflare (free plan)
Container	Docker

10. Deployment Options

Current Production Architecture

ServicePro is deployed using Render web services with Cloudflare DNS providing SSL termination, CDN caching, and DDoS protection.

Component	Deployment Target	Purpose
API Service	Render Web Service (Node.js)	Business logic and data API
Tenant App	Render Web Service (Next.js)	Internal user workspace
Customer Portal	Render Web Service (Next.js)	Customer self-service application

Subdomain Model

Each application occupies its own subdomain for security isolation and independent scaling:

Subdomain	Application
app.<domain>	Tenant workspace
portal.<domain>	Customer portal
api.<domain>	REST API
admin.<domain>	Platform administration (planned independent deployment)

Infrastructure Characteristics

- SSL termination: Handled by Cloudflare proxy (all traffic encrypted in transit)
- CDN caching: Static assets cached at Cloudflare edge

- DDoS protection: Cloudflare WAF on free plan provides baseline protection
- Auto-deploy: Triggered on CI passing for configured branches
- Health checks: Platform monitors /readyz endpoints for automatic rollback on failed deploys
- Scaling: Each service scales independently based on its resource profile

Containerized Deployment

Docker and docker-compose configurations support:

- Local development with hot-reload
- Production builds with multi-stage Dockerfile
- PostgreSQL backing service in compose stack
- Environment-based configuration (development, production)

Environment Configuration

Configuration is managed through environment variables with isolated envelopes per service:

- Database credentials isolated to API service
- JWT secrets shared only with services that validate tokens
- Third-party API keys restricted to services that consume them
- Feature flags and tenant configuration stored in the database

11. Security and Governance

Authentication Framework

Capability	Implementation	Status
User authentication	JWT Bearer tokens with configurable expiration	Available
Multi-factor authentication	TOTP-based MFA with authenticator app support	Available
Password security	Minimum requirements enforcement, reset via token	Available
Portal authentication	Separate token issuance for customer audience	Available
Platform authentication	Elevated tokens for admin operations	Available
Session management	Configurable TTL, forced logout capability	Available
Invitation-based onboarding	Token-gated account activation	Available

Authorization Model

ServicePro implements a layered authorization system:

- 1 Role-based access control (RBAC): Six preset roles (owner, admin, manager, technician, billing, read-only) with automatic permission assignment
- 2 Permission-level enforcement: Individual permissions checked at route level before handler execution

- 3 Module access control: Tenant-level module enablement controls which feature areas are accessible
- 4 Owner access guard: Ensures the authenticated user belongs to the target tenant
- 5 Audience separation: Portal tokens cannot access internal routes; platform tokens cannot access customer routes

Tenant Data Isolation

- Every request passes through tenant middleware before reaching business logic
- Repository queries include tenant context as a mandatory parameter
- No cross-tenant data retrieval is possible through the API
- Platform administration uses dedicated endpoints with elevated permissions

Security Middleware Stack

Layer	Purpose
Security headers	Standard security response headers on all requests
CORS enforcement	Explicit origin whitelist; unrecognized origins receive no ACAO header
Rate limiting	Configurable request limits with stricter auth-endpoint limits
Body limit	Maximum payload size enforcement prevents resource exhaustion
Request ID	Unique identifier for request tracing and correlation
Request audit	Automatic audit trail entry for state-changing operations
Route validation	Input validation before business logic execution

Audit and Compliance

- Comprehensive audit logging for all state-changing operations
- Security event capture (failed logins, permission denials, suspicious patterns)
- Integrity checking for configuration and data consistency
- Data retention policies with configurable retention periods
- Privacy operations: DSAR processing, consent records, breach notifications
- Compliance evidence collection and control monitoring

What ServicePro Does NOT Claim

ServicePro does not hold or claim the following certifications or guarantees at this time:

- SOC 2 Type I or Type II certification
- ISO 27001 certification
- HIPAA compliance attestation
- PCI DSS certification
- FedRAMP authorization
- Specific uptime SLA percentages

> The platform provides frameworks and tooling to support organizations pursuing these certifications. Actual certification requires independent audit and attestation.

12. Implementation and Adoption

Implementation Phases

Phase 1: Discovery and Planning (Week 1–2)

- Requirements gathering and business process mapping
- Industry pack selection and configuration planning
- User role definition and permission matrix design
- Integration requirements and data migration scope
- Success criteria definition and timeline agreement

Phase 2: Configuration and Setup (Week 2–4)

- Tenant provisioning with company branding and settings
- Industry service pack installation and customization
- Price book configuration with services, rates, and materials
- User account creation and role assignment
- Customer portal setup and branding
- Workflow automation rule configuration

Phase 3: Data Migration (Week 3–5)

- Customer data import (contacts, addresses, equipment records)
- Service history migration for continuity
- Inventory baseline establishment
- Open estimate and invoice migration
- Knowledge base population with standard procedures

Phase 4: Training and Validation (Week 4–6)

- Role-specific training sessions (dispatchers, technicians, office staff, managers)
- Documentation volume access for self-service learning (16 volumes covering every role)
- Workflow testing with realistic scenarios
- Customer portal pilot with selected customers
- Integration testing with connected systems

Phase 5: Go-Live and Hypercare (Week 6–8)

- Production cutover with monitoring

- Daily check-ins during first week of live operations
- Issue resolution and adjustment
- User adoption tracking and coaching
- Performance baseline establishment

Phase 6: Optimization (Ongoing)

- Usage analytics review and feature adoption expansion
- Workflow automation refinement based on operational patterns
- Report and dashboard optimization
- Additional marketplace pack installation as needs evolve
- Periodic access review and security hardening

Training Resources

ServicePro includes a comprehensive 16-volume documentation and learning center accessible within the platform:

Volume	Title	Audience
1	Getting Started Guide	All users
2	Customer Portal Guide	Customers
3	Technician & Employee Field Guide	Technicians
4	Dispatcher Operations Manual	Dispatchers
5	CRM & Sales Pipeline Guide	Sales, managers
6	Inventory Management Guide	Inventory teams
7	Financial & Billing Guide	Finance, office staff
8	Marketing & Growth Guide	Marketing
9	Website Builder Guide	Website admins
10	AI Assistant & Knowledge Base Guide	All users
11	Workflow Automation Guide	Managers, admins
12	Company Administrator Guide	Company admins
13	Platform Administrator Guide	Platform admins
14	API Reference & Developer Guide	Developers
15	Troubleshooting Guide	All users
16	Keyboard Shortcuts & Quick Reference	All users

13. Business Outcomes

Organizations adopting ServicePro can reasonably expect the following outcomes based on the platform's design and capability set. These are directional benefits, not guaranteed metrics.

Operational Efficiency

- Reduced scheduling gaps: Dispatch board visibility and territory management help maximize technician utilization throughout the day
- Faster invoicing: Work-order-to-invoice conversion eliminates days of delay between job completion and billing
- Lower administrative overhead: Automation rules handle repetitive tasks (status updates, notifications, follow-ups) that previously required manual effort
- Fewer data entry errors: Single-platform design eliminates re-keying data between disconnected systems

Revenue Impact

- Shorter sales cycles: Estimates created and sent from the field while the customer is present
- Improved collection rates: Online payment links reduce friction between invoice delivery and payment
- Reduced revenue leakage: Automated invoice generation ensures billable work is always captured
- New customer acquisition: Website builder and public storefront create an always-on lead generation channel

Customer Experience

- Self-service convenience: Customers book, pay, and communicate without waiting for business hours
- Proactive communication: Automated appointment confirmations and technician-en-route notifications set expectations
- Transparency: Portal access to service history, estimates, and equipment records builds trust
- Faster response times: Streamlined intake reduces time from customer request to scheduled appointment

Team Productivity

- Technician empowerment: Mobile-first field interface with customer history and checklists reduces callbacks and repeat visits
- Dispatcher effectiveness: Visual board with real-time status eliminates phone-tag coordination
- Manager insight: Real-time dashboards surface issues early rather than in end-of-month reviews
- Onboarding speed: Comprehensive documentation library reduces time for new employees to become productive

14. Competitive Differentiators

ServicePro differentiates through architectural and functional advantages that are difficult to replicate by assembling point solutions:

Unified Data Model

All modules share the same underlying data. A customer record connects to their equipment, service history, invoices, communications, and portal access without integration middleware. This eliminates synchronization failures between disconnected systems.

Multi-Tenant from Day One

The platform was designed for multi-tenancy from its foundation — not retrofitted. Tenant isolation, per-tenant configuration, and module access control are inherent to the architecture, not add-ons.

Trade-Specific Configuration via Marketplace

Rather than generic "field service" workflows, ServicePro provides 30+ trade-specific packs that configure terminology, checklists, pricing structures, and job templates for each industry. A plumbing company and a solar installer use the same platform but with different operational vocabularies and workflows.

Customer Portal as First-Class Application

The customer portal is not a stripped-down view of the main interface — it is a purpose-built application with its own authentication, UX, and deployment. This enables customer-facing interactions at the same quality level as internal operations.

Full-Stack Ownership

From website (customer acquisition) through portal (customer self-service) through work orders (service delivery) through invoicing (revenue collection), ServicePro owns the entire service business value chain. This eliminates the integration tax of connecting separate systems for each stage.

API-First Architecture

Every feature accessible through the UI is also accessible through the REST API. This enables automation, custom integrations, and partner development without workarounds or screen-scraping.

Progressive Complexity

A three-person plumbing company uses the same platform as a 200-technician enterprise. The module access system, tier-based feature availability, and role-based views ensure each organization sees appropriate complexity for their size.

Security as Architecture (Not Afterthought)

Tenant isolation, CORS whitelisting, audience-separated tokens, rate limiting, and audit logging are middleware-layer features that apply to every request — not optional features that must be enabled.

15. Buyer Evaluation Checklist

Use this checklist to evaluate ServicePro against your organization's requirements.

Business Fit

- ☐ Does the platform support your specific trade/industry? (Check marketplace packs in Section 7)
- ☐ Does the pricing tier match your team size and feature needs? (Section 8)
- ☐ Can the platform support your current and projected job volume?

- ☐ Does the customer portal align with how your customers prefer to interact?

Workflow Requirements

- ☐ Can your dispatch workflow be replicated on the dispatch board?
- ☐ Does the estimate-to-invoice flow match your billing process?
- ☐ Can your service agreements and recurring work be modeled?
- ☐ Does the inventory system support your warehouse and truck stock structure?
- ☐ Can workflow automation replace your manual notification and follow-up processes?

User Roles and Access

- ☐ Do the six preset roles (owner, admin, manager, technician, billing, read-only) cover your team structure?
- ☐ Does module-level access control provide sufficient feature segmentation?
- ☐ Can your technicians use the mobile interface effectively in the field?
- ☐ Do your customers need portal features beyond booking, payments, and messaging?

Technical and Security

- ☐ Does JWT-based authentication meet your security requirements?
- ☐ Is MFA support sufficient for your compliance needs?
- ☐ Does the audit trail provide the retention depth you require?
- ☐ Are the rate limiting and CORS configurations adequate for your security posture?
- ☐ Does the API architecture support your integration requirements?
- ☐ Is the deployment model (Render + Cloudflare) acceptable for your infrastructure policy?

Data and Integration

- ☐ Can your existing customer data be migrated into ServicePro's data model?
- ☐ Do marketplace connectors (accounting, payments) integrate with your current tools?
- ☐ Does the REST API provide sufficient access for custom integrations?
- ☐ Are data export capabilities adequate for your reporting and BI needs?

Compliance and Governance

- ☐ Does the privacy operations module support your GDPR/CCPA obligations?
- ☐ Does the audit trail meet your regulatory retention requirements?
- ☐ Are data residency requirements compatible with the deployment model?
- ☐ Do you require specific compliance certifications not yet held by ServicePro?

Growth and Scale

- ☐ Can the platform accommodate your growth plan (more users, locations, volume)?
- ☐ Does the multi-tenant architecture support your expansion model?
- ☐ Are additional marketplace packs available as you expand into adjacent trades?
- ☐ Does the API enable partner and ecosystem development you may need?

16. FAQ

Q1: What types of businesses is ServicePro designed for? ServicePro is designed for field service businesses including plumbing, HVAC, electrical, pest control, landscaping, cleaning, roofing, solar, appliance repair, and 20+ additional trades. Any business that dispatches technicians to perform service at customer locations is a fit.

Q2: Can we try ServicePro before committing? Yes. The platform supports lightweight JSON-backed deployments for evaluation purposes. A production decision should be backed by a PostgreSQL deployment for data durability and multi-tenant isolation.

Q3: How long does implementation typically take? A standard implementation follows a 6–8 week timeline covering discovery, configuration, data migration, training, go-live, and optimization. Simpler deployments with minimal data migration can be operational faster.

Q4: Do our customers need to install anything to use the portal? No. The customer portal is a web application accessible from any modern browser on phones, tablets, and computers. No app installation is required.

Q5: Can we use our own domain name? Yes. Custom domain support is available through Cloudflare DNS configuration. Your portal, website, and application can be addressed at subdomains of your own domain.

Q6: How is our data isolated from other businesses on the platform? Every API request passes through tenant middleware that scopes all data operations to your business. Another tenant cannot access your data through any API endpoint. This isolation is enforced at the middleware layer, not just the application layer.

Q7: What happens if we outgrow our current tier? Tier upgrades are non-disruptive. Module access controls are updated to unlock additional features, and no data migration is required. Your existing configuration, users, and data remain intact.

Q8: Can ServicePro integrate with our accounting software? The marketplace includes an Accounting Connector that synchronizes customers, invoices, payments, and tax summaries with external accounting platforms. Additionally, the REST API enables custom integrations with any system that can make HTTP requests.

Q9: What level of technical expertise is needed to administer ServicePro? Day-to-day administration (user management, settings, workflow configuration) requires no technical expertise — it is designed for business users. API integrations and advanced automation may require developer involvement.

Q10: How does the AI assistant work? The AI assistant uses the knowledge base content to answer questions in natural language. Users can ask about procedures, policies, or platform features and receive contextual answers. The knowledge base is populated by the business — it learns what you teach it.

Q11: Can technicians use ServicePro offline? Mobile offline support is part of the platform roadmap. Currently, the mobile application requires network connectivity to synchronize job data and complete work orders.

Q12: What databases does ServicePro support? Production deployments use PostgreSQL. Development and evaluation environments can use the built-in JSON file store. The data access layer abstracts storage through a

provider pattern, but PostgreSQL is the recommended production database.

Q13: How are software updates delivered? Updates are deployed as new versions of the hosted services. For cloud-hosted deployments, updates are applied automatically after passing CI verification. For self-managed deployments, migration scripts handle schema updates.

Q14: Can we configure which features are available to our team? Yes. Module access control allows administrators to enable or disable feature areas (operations, CRM, inventory, billing, analytics, knowledge, communications, marketplace, administration) per tenant. Individual user roles further restrict access within enabled modules.

Q15: Does ServicePro support multiple locations or brands? Yes. Multi-workspace support enables organizations to manage multiple operational contexts. Each can have independent configuration, branding, and user assignments while sharing platform administration.

Q16: What reporting capabilities are available? ServicePro includes a pre-built report catalog covering revenue, jobs, technician performance, and customer metrics. Custom reports can be created with field selection and filtering. Scheduled reports deliver results automatically via email. Data export (CSV) enables external analysis.

Q17: How is the customer portal branded? The customer portal inherits the tenant's branding configuration including company name, logo, colors, and contact information. Customers see your brand, not ServicePro's.

Q18: What security certifications does ServicePro hold? ServicePro does not currently hold third-party security certifications (SOC 2, ISO 27001, etc.). The platform implements security controls (encryption in transit, JWT authentication, MFA, RBAC, audit trails, rate limiting) that support organizations pursuing such certifications, but independent audit and attestation have not been completed.

Q19: Can we build custom integrations? Yes. The REST API exposes all platform functions with JWT-authenticated access. Per-tenant API keys enable service-to-service integration. The OpenAPI specification provides a machine-readable contract for integration development.

Q20: What support is available during and after implementation? Implementation support is provided during the onboarding phases. Post-implementation, the 16-volume documentation library, AI assistant, and knowledge base provide self-service support. Enterprise tier customers receive dedicated support channels.

Q21: How does the workflow automation engine work? The workflow engine uses a trigger-condition-action model. Triggers fire on events (job created, status changed, payment received). Conditions filter which events proceed. Actions execute automatically (send notification, create invoice, update status, assign technician). Rules are configured through the automation builder interface.

Q22: Can customers pay invoices through the portal? The customer portal displays invoices with payment status. Online payment collection requires configuration of the Payments Connector from the marketplace, which integrates with supported payment processors.

Q23: What is the uptime commitment? ServicePro does not publish a specific uptime SLA percentage at this time. The platform is deployed on Render with Cloudflare providing CDN and DDoS protection. Health check endpoints enable automatic rollback on failed deployments.

Q24: How is pricing calculated? Pricing is structured by tier (based on team size and feature set). Specific per-seat and per-tier pricing is determined by commercial leadership and is not embedded in the platform code. Contact sales for current pricing.

17. Next Steps and Call to Action

Ready to Evaluate?

- 1 Schedule a Discovery Call — Discuss your business requirements with our solutions team
 - Contact: [Sales Contact]
 - Email: [Sales Email]
 - Phone: [Sales Phone]
- 1 Request a Guided Demo — See ServicePro configured for your specific industry with live data
 - Demo request: [Demo Request URL]
- 1 Start a Technical Evaluation — Access the platform in a sandbox environment to validate technical fit
 - Evaluation request: [Evaluation Request URL]
- 1 Review the API — Explore the REST API and integration capabilities
 - API documentation: [API Documentation URL]
- 1 Plan Implementation — Work with our implementation team to scope your rollout
 - Implementation inquiry: [Implementation Email]

For Partners

- Integration Partners: Access the API and connector framework to build integrations
- Partner portal: [Partner Portal URL]
- Reseller Partners: White-label and managed service delivery options available at the Platform tier
- Partner program: [Partner Program Email]
- Technology Partners: Marketplace publishing for industry packs and extensions
- Marketplace submission: [Marketplace Email]

For Investors

- Platform architecture documentation available under NDA
- Technical due diligence package: [Investor Relations Email]

18. Glossary

Term	Definition
SaaS	Software as a Service — cloud-hosted application accessed via web browser without local installation
Tenant	A single business (company) operating within the ServicePro platform with isolated data and configuration
Multi-tenancy	Architecture where multiple businesses share platform infrastructure while maintaining strict data isolation
CRM	Customer Relationship Management — system for tracking leads, customers, and sales interactions

Term	Definition
Dispatch	The process of assigning technicians to jobs based on availability, skills, and location
Work Order	A digital job record tracking service from creation through completion, including details, status, and materials used
API	Application Programming Interface — programmatic access point enabling system-to-system communication
REST API	An API design style using HTTP methods (GET, POST, PUT, DELETE) with resource-based URLs
JWT	JSON Web Token — a signed token used for stateless authentication between client and server
OAuth	An authorization framework enabling third-party applications to access resources on behalf of a user
MFA	Multi-Factor Authentication — requiring a second verification method (e.g., authenticator app) beyond password
RBAC	Role-Based Access Control — assigning permissions to users through defined roles rather than individually
CORS	Cross-Origin Resource Sharing — browser security mechanism controlling which domains can make API requests
Webhook	An HTTP callback triggered by an event, enabling real-time notifications between systems
SSO	Single Sign-On — authentication pattern allowing one login to access multiple applications
Service Pack	A marketplace item that configures ServicePro with industry-specific templates, checklists, and pricing
Connector	A marketplace integration that synchronizes data between ServicePro and an external system
Price Book	The catalog of services, rates, and materials used to generate estimates and invoices
SLA	Service Level Agreement — a commitment to specific performance standards (response time, uptime)
Storefront	A public-facing website presenting the business's services and enabling customer inquiries
Customer Portal	A secure web application where end customers manage their service account (bookings, payments, messages)
Tenant Middleware	Server-side code that ensures all data operations are scoped to the authenticated user's business
Feature Gate	A configuration switch that enables or disables platform capabilities at the tenant or platform level
Module Access	A permission layer controlling which functional areas (CRM, billing, inventory, etc.) a tenant can access
Audit Trail	A chronological record of system activities (who did what, when) for security and compliance review
Rate Limiting	A throttling mechanism that restricts the number of API requests within a time window
CDN	Content Delivery Network — geographically distributed cache that serves static content from the nearest edge location
Monorepo	A single source code repository containing multiple applications and shared libraries
Turborepo	A build system for JavaScript/TypeScript monorepos that enables incremental builds and task orchestration
PostgreSQL	An open-source relational database system used for production data storage
DSAR	Data Subject Access Request — a formal request from an individual to access, correct, or delete their personal data

Document generated from repository source at version 8.0.0-alpha.1. Feature availability reflects implementation status as evidenced in the codebase. Contact [Sales Email] for the latest product roadmap and pricing.
